

Homework G.13 - Solution

Example Quadrotor roll control:

Differential equation (after linearisation) is ²

$$J \ddot{\phi} = \tau + w$$

\uparrow \uparrow \uparrow
 rolling inertia ϕ roll angle τ applied rolling torque w neglected dynamics/wind/etc

The transfer function is

$$\phi(s) = \frac{1}{J s^2} (\tau(s) + w)$$

Assuming stability,
What kind of disturbances can this system reject if

a) $D(s) = k_p + k_d s$

b) $D(s) = k_p + \frac{k_I}{s} + k_d s$?

$$l_{ss} = \lim_{s \rightarrow 0} \frac{-G}{1 + G D} \frac{1}{s^2}$$

$$= \lim_{s \rightarrow 0} \frac{\frac{1}{J s^2}}{1 + \frac{1}{J s^2} (k_p + k_d s + \frac{k_I}{s})} \frac{1}{s^2}$$

$$= \lim_{s \rightarrow 0} \frac{1}{J s^2 + k_p + k_d s + \frac{k_I}{s}} \frac{1}{s^2}$$

$$= \lim_{s \rightarrow 0} \frac{s}{J s^3 + k_d s^2 + k_p s + k_I} \frac{1}{s^2}$$

a) If $k_I = 0$ then

$$e_{ss} = \lim_{s \rightarrow 0} \frac{1}{Ts^2 + k_D s + k_P} \frac{1}{s^2}$$

which is finite if $q=0$. So the system is type 0 and the steady state error induced by a step disturbance is $e_{ss} = \frac{1}{k_P}$

b) If $k_I \neq 0$ then

$$e_{ss} = \lim_{s \rightarrow 0} \frac{s}{Ts^3 + k_D s^2 + k_P s + k_I} \frac{1}{s^2}$$

which is zero if $q=0$, and finite if $q=1$.
 i.e. the system is type 1 and the steady state error induced by a ramp disturbance is $e_{ss} = \frac{1}{k_I}$.
